Internet Explorer

When using computers, I always use the best and never settle for anything beneath my computing standards. The browser is a hugely important part of my computing experience. Like many others, I use what is called Web 2.0, where it seems like your life can be accessed through a browser. What better way to access this revolutionary content than with THE efficient, security conscious, browser, one that renders your web site better than any other on the web. If you have not already guessed what browser I am talking about, it is obviously only your operating system itself keeping you from using the best tools in the business. This revolutionary browser is none other than Microsoft Internet Explorer.

When you get a computer, one of the expectations is that it will be fast enough to suite your needs. In fact, this is what a majority of people want from there expensive purchase. Time efficiency is where Internet Explorer shines. The startup is efficient and gives you enough time to wiggle your mouse around 10 times, then sit quietly and wait for the screen while carefully considering the URI you intend to visit. In total you will be left with 5 seconds of peaceful time listening to your hard drive click. for slower computers this start up time increases, allowing for longer consideration and much needed rest from the work of locating and finding the giant blue lower case “e” and tiring your finger

by clicking. The time Microsoft Internet Explorer gives you is barely touched by any other browsers. You will be thinking to yourself “this is strange” I thought you were talking about the speed of computers at the beginning of this paragraph, not the lack of it. In this case you need to realize that speed is all relative. Some computers load everything faster than you could possibly react to, in this case no time is saved, it is wasted. A fast lightweight browser will load too fast and waste your valuable time. Instead of contemplating the things you are about to enter in to the computer, you are overwhelmed by the sensory overload caused when the browser appears promoting you for your immediate attention flashing different colors on the screen as soon as you click it. 10 years ago they had computers right, you had time to spare and everything was just the right speed. As of now Microsoft Internet Explorer is the only browser keeping the time efficiency legacy the perfect ratio of thumb twirling, mind numbing waiting to exhaustive, carpal tunneling work.

If you want a good browser that does not restrict your browsing experience, look no further than Microsoft Internet Explorer. Internet Explorer allows many fun applications to install without your consent. The browser is built in a way that these things can be installed without the users consent, this makes the browsing experience less interrupted and frees up the time that you would usually take finding and installing malicious software. Another way the browser experience is enhanced is with the use of toolbars, with some browser would you believe there is only one search box. Some internet browsers are so restrictive that they only let the user use one search box, and on top of that there is only one search button. Imagine having to search from the same place every time you want to look up some trivial information on the internet. This is restrictive and the people over at Microsoft would never have that in their browser. Instead the normal Internet Explorer user has the freedom that comes from choice. On a typical computer running internet explorer the user will have anywhere from three to five search

toolbars, and at least one miscellaneous bar installed by the local security software. While some browser waste all the space of the browser window with the web page itself, Microsoft's Internet Explorer claims this space for something that you would actually use, such as the Google toolbar, with this fancy toolbar, it will show you a light whenever you have an email, but only on gmail, to know if you have any email on Yahoo email, you can just use the Yahoo toolbar. On a personal note, I recently installed an application that “recommended” that I install the free all new BING toolbar. I was overjoyed that I had another place to check my weather, keep track of my relevant news updates, and of course search the internet. I obviously was not satisfied with my three other search boxes, and just using the Google toolbar for news did not suit my needs. And while you are busy installing toolbars grab the Ask Toolbar, this one lets you search using the ask search engine. You will surely want more of these usefully toolbars, because they improve your browsing experience significantly, and do something useful with the large area in the middle of the browsers where all the pictures and words appear.

Beyond all other reasons to use Microsoft Internet Explorer , like time efficiency, security, and usefulness, perhaps the most enticing reason to use internet you cannot actually see with just look. You need to use Microsoft Internet Explorer to appreciate the standard compliance of the browsers rendering engine. Some inferior browser, notably Mozilla Firefox, will render the page exactly as it was intended to be viewed. For some users this is just alright, because most sites do not require such a complex rendering engine. The rendering engine in Mozilla Firefox will always show complicated web elements without errors. But since Microsoft's Internet Explorer is too advanced to be standards compliant. Because it is the most used browser in the United States, you could call it the reference browser. It does not matter what websites look like on other browsers, because however it looks on

Internet Explorer is right, no matter how many errors occurred when rendering the page. Most developers try to work around what they think are deficiencies in Internet Explorer by using a separate CSS, but that is just because they feel insecure using their non MSIE Browser. They think that the real way to experience the page is how they intend it to look. This is most certainly not the case. If you use the browser of the majority, you are viewing the correct page no matter what the w3c Says.

Microsoft's Internet Explorer is the only browser to consider when you are considering browsers at all. While the time efficiency , security, usability, and “rendering majority” make it the clear choice for your default browser. Microsoft Internet Explorer is a one of a kind browser, and capabilities should not be overlooked. After reading this [satire](#) I am sure that you have made up your mind about where you will browse the internet. Do yourself a favor and use the best, settle for nothing else, use the best browser available on the PC.
